ETS FOR ANIMALS

Every animal-friendly home and vet's office should have a bottle of ETS for Animals. This solution is for the assorted problems experienced by any animal, of any size or age — furred, feathered and scaled.

Don't forget to give ETS for Animals during times of animal stress (think thunderstorms, vet visits or vacation!) and other times of unscheduled difficult events.

Dosage: 10–12 drops (one dropperful)

Give two or three times, 5 minutes apart.

Do not dilute.

How to Administer

In order to avoid contaminating the bottle of ETS for Animals and to keep your animal safe from broken glass, do not give your animal its dosage directly from the dropper. Instead, give the solution to your animal by putting a dose (10–12 drops) in your hand, a clean spoon or bowl, or a clean plastic syringe. If your animal insists on being enticed, put the 10–12 drops of ETS for Animals on the tiniest amount possible of irresistible food.

ABOUT PERELANDRA ETS FOR HUMANS

Perelandra's ETS for Humans is the perfect solution that fits everyone's needs for any sudden or "unscheduled" physical, emotional or mental situation that can be large or small, serious or passing. It's for all those events that can occur throughout our day that we don't plan for, would have appreciated not happening, and that cause anger, frustration, confusion, pain, panic, irritation, and fear. When these kinds of "intrusions" occur, we immediately reach for and take ETS for Humans. It is pre-mixed, convenient, easy to take, and perfect for those times when we aren't able to think straight. Once we stabilize ourselves with ETS, we are better able to intelligently and calmly turn our attention to what else we need to do to address what has just occurred.

ETS is safe and all natural. It may be used by everyone. It may be given to family members, friends, enemies, neighbors, and children. To use ETS best (within the first twenty minutes of the event), it is important to have a bottle within easy reach should one of those unscheduled intrusions occur. (Because they are unscheduled, you just never know when they are going to happen!) This would include having a bottle in the kitchen, bathroom, bedroom, workshop, office, gym bag, school locker, dorm room, computer bag, briefcase, car glove compartment, bike bag, pocket and purse. It's also helpful to keep a bottle by the television and phone when hearing difficult or bad news. If you are klutzy and tend to be accident prone or you have young children running around and getting into trouble, you might just want to hang a bottle of ETS around your neck each morning before starting your day! And if your job entails risk—physical or emotional—you definitely need to keep a bottle with you at all times. Because ETS is safe and natural, you may take it daily and multiple times a day as each situation arises.

ETS is an oral solution which is safe for adults and children. Besides taking a dropperful (10-12 drops) orally, you may apply it topically. And for those times when life won't stop and you are overwhelmed physically and/or emotionally, you may add ETS to your bath water and totally submerge your battered self for overall relief.

HAVE ETS HANDY

It's important to have ETS within easy reach should a sudden problem occur. Really. It's so annoying to have to go on a search mission right at that critical time. Think about the danger zones for you and your family and put a bottle of ETS in each location.

DIRECTIONS & DOSAGE

Adults

ETS is an oral solution. Take 10-12 drops (one dropperful), 1-4 times within the first 20 minutes of the challenging unscheduled event.

Do not dilute ETS. Do not take less than 10-12 drops.

Take it directly from the dropper. Should the dropper touch your mouth or tongue, to wash the dropper well before putting it back in the bottle.

Children (Age 10 and Under, and Infants)

Administer 5-6 drops 2-4 times within the first 20 minutes of the challenging unscheduled event.

Do not dilute ETS when administering to children. Do not administer less than 5-6 drops.

Give the drops directly from the dropper. Should the dropper touch your child's mouth or tongue, be sure to wash the dropper well before putting it back in the bottle.

Newborns (Up to Nine Months)

Up to nine months of age, place 10 drops on the baby's forehead, a few drops at a time, and gently massage them into the skin. After they pass nine months, they will need to take 5-6 drops orally.

IMPORTANT

ETS stabilizes you physically, mentally and emotionally through the electric system after a difficult emotional, mental or physical experience. It does not take the place of needed and qualified medical attention such as having a broken bone set, receiving stitches or taking needed medications. In such cases, you would take ETS immediately after the problem occurs so that you can think straight, make good decisions and get the best medical treatment and care.

OTHER EXAMPLES OF WHEN TO TAKE ETS

Situations

After hospital visits and/or visits to a sick friend resulting in exposure to disease-causing viruses, fungi and bacteria; exposure to industrial and home chemicals, cleaners, insecticides, herbicides, fertilizers and pesticides; exposure to high levels of air or water pollution; right after a difficult medical treatment or doctor's appointment; after over-exposure to serious weather conditions; after each counseling/therapeutic session; after physical therapy sessions, during and immediately after a reaction (emotional or physical) to battle-related experiences (domestic and military); while experiencing bouts of emotional over-reaction; after a difficult family visit or discussion/argument; grief; the anniversary of a personal crisis or death of a loved one...

If you are a parent, you will want to have ETS available for your child's difficult adventures through life, as well as for yourself for getting through your child's accidents and illnesses.

Shocking Personal, Local and Global News

You've just heard someone you know has died or been killed, another terrorist attack has occurred, war is breaking out, people (especially children) are suffering from famine and starving to death, a natural disaster has destroyed everything in its path and killed many, a pandemic or epidemic has broken out, a nuclear reactor is damaged and could result in a meltdown... You've just been fired, failed a test, received bad news about a family member or friend, received a call from a bill collector or the bank, been told you have a serious illness or disease, been told your spouse wants a divorce, your car has been stolen, you've been robbed, you've just been told you've been exposed to something toxic, you just read this list...

Multiple Challenges that Result from Difficult Events

Example: You had one of those annoying, unscheduled problems arise for which you took your ETS during the first twenty minutes. The ETS stabilized you well. And now it's a day later or weeks later and you are recuperating from that annoying problem. You wake up one morning and realize that you have taken a step backward in your recuperation process and are feeling discomfort. Or you suddenly feel awful during the day. Assume you have experienced a new part of the problem that is impacting your recuperation process and take ETS again three or four times within the first twenty minutes of experiencing the new discomfort.

Another example: We have the same scenario as described above. Only this time you are not near your ETS bottle for hours. If you still experience the new discomfort once you have access to ETS again, consider that your first twenty minutes begins at that point and take ETS three or four times within the next twenty minutes.

A third example: You have made a major life-changing decision. Take ETS several times daily as the decision and you settle into place together. But big decisions and changes always come with a whole package of challenges that you need to address in order to make all the changes that the big decision requires. Take ETS daily as you move through each challenge.

Daily Doses of ETS

If your workplace or home are regularly exposed to chemicals, biological agents, cleaners, insecticides, herbicides, fertilizers, pesticides or radiation, take three or more doses of ETS (10-12 drops) throughout the day, including one dose in the evening before bedtime. You would also take these daily doses any day(s) your area has high levels of air pollution or if you are exposed to water pollution on a regular basis. And if you work in a “sick building,” you will benefit from taking ETS three or more times a day, including at bedtime. Should you experience stress or unusual difficulty in your job or home situation (e.g., fears and concerns about a member of the military who is deployed in a war zone, a family member who is an alcoholic or taking drugs, or you are taking care of a chronically ill or elderly person...), your health and well-being will benefit from several doses of ETS throughout your day, including one dose at bedtime. People who work in high-intensity jobs such as EMT response, trauma care, hospital emergency rooms, police, firefighters, 911 operators, suicide hot line operators... These kinds of jobs have trauma built into them. Take ETS regularly several times throughout the day.

Wednesdays, 10 AM – 8 PM, eastern

ETS BIRTH-STABILIZING PROCESS*

We can now greatly expand the range of support for both mother and child during the birthing process by taking ETS.

- **Labor and Birth.** As soon as contractions begin, take two doses (10-12 drops per dose) of ETS. Focus on yourself for the first dose and on the baby for the second dose. If labor proceeds naturally and without any problems, this initial dose of ETS is all you and the baby will need. However, should a problem arise or should you feel overly stressed or panicked during labor, take another dose of ETS immediately for yourself and a second dose for the baby.
- **Tell Dad** (or whoever is assisting or coaching you) to take a dose of ETS once labor begins so that he can be more helpful during the process and less annoying. Should he feel woozy, faint or become overwhelmed at any time during the process, he's to take another dose.

As Soon as Possible After the Birth

- **Mom.** Take one dose of ETS for your part of the birthing process.
- **Baby.** Tell someone to place ten drops of ETS on your forehead and gently rub the drops into the skin. (It would help if they held the bottle in their hands to warm the solution before putting the drops on your forehead. After all, you're brand new to this life and deserve a little extra TLC.) Then tell them to let your forehead air dry. Finally, tell them to cuddle you like crazy and tell you how perfect you are. (If they don't say any of this to you, throw up on them.)
- **Dad.** Take one dose of ETS to balance out the intensity of your own experience during the birthing process and the shock of realizing the baby is finally here and is actually lying there staring at you. If, after looking at them closely, you see that they are mouthing the word "College," you may need to take another dose of ETS.

* The ETS Birth-Stabilizing Process is to be used *IN CONJUNCTION* with the proper medical care needed throughout labor and birth.

ETS BATH

The full-immersion experience. An ETS bath works wonders for every-thing from physical and emotional stress, over-doing outdoor or sports activities, or just recovering from life...

For an ETS bath, put 1/4 cup (two ounces) ETS in a full bath and soak for 20 minutes. Do not add any other bath ingredients such as bubble baths, salts, oils, etc. If you use PKTT (Perelandra Kinesiology Testing Technique), you can test for how many nights or what rhythm (weekly? monthly?) you would benefit from an ETS bath.

If you hate sitting in a tub or don't have time for this, but you know you could benefit from a full immersion, put undiluted ETS in a spray bottle and spray the solution over your whole body. (You need to be naked for this!) Then air dry. It should take just a few minutes. Pour any remaining ETS back into its dropper bottle each time you have finished spraying. Don't let it sit in the spray bottle.

CONTENTS

Perelandra ETS has been created by Machaelle Wright and nature using a combination of electrical infusions from 153 different plants, minerals, natural gases and elements found in the sea, atmosphere and on land. During the production process, Machaelle works with nature to combine the components needed. In the first phase of the process, nature restores each element back to its original state of balance, thus eliminating any damage that has been caused by environmental breakdown and human interference. This allows ETS to be made with “clean” ingredients. In the next phase of the production process, the balanced electrical patterns for each of these elements are combined. The somewhat explosive result is a completely new, single, complex electrical pattern that has as its foundation the patterns from all the elements required for the ETS.

The ETS electrical patterns are then released to and stabilized in water. ETS is preserved in brandy or distilled white vinegar. It is natural and by using only electrical patterns rather than the physical elements from the 153 “ingredients” that create the new electrical patterns, no allergic reactions or side effects are triggered—unless you are allergic to water, vinegar or brandy. (If none of this makes sense to you, just remember that you probably don't understand how your microwave or television works, yet you can use them quite successfully. With ETS, you may not understand how this thing is produced but, like the microwave, you can still use it successfully and with excellent results.)
