

## *Biological Triangulation and Microbial Balancing for Disease*

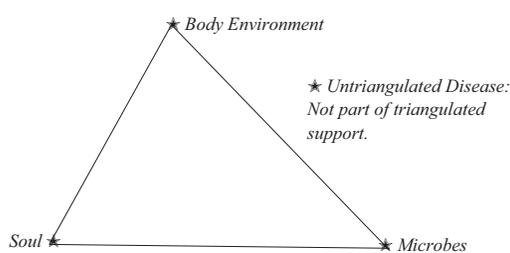

by Machaelle Small Wright

**T**riangulation is a natural phenomenon that occurs within a specific, defined area of an environment. It is the linking of three individual dynamics or components within that environment. To create greater strength and balance, one component or dynamic will connect with two other appropriate components or dynamics within the same environment, forming a triangle. The triangle creates a linked, three-point configuration of energy that serves to strengthen and stabilize each point of the triangle—*beyond* that which would have occurred had no triangulation taken place.

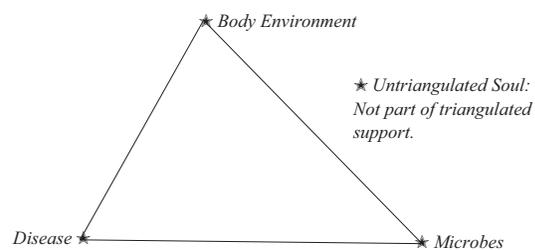

When a person experiences relative health and balance, a triangle is present. This triangle occurs between (1) the body environment, (2) the body's microbial population, and (3) the person's soul (see diagram below, left). In this triangle, the soul provides the input that lays the foundation for defining the person's state of balance. The other two points of the triangle, the body environment and the body's microbes, reflect the soul's input. This results in a triangle that is supportive of the soul's partnership with its body. In fact, the triangle strengthens, stabilizes and supports the body/soul partnership.

When a human has a serious disease or health issue, a different triangle forms between (1) the body environment, (2) the body's microbial population, and (3) the disease or health issue. This particular triangle is a problem because it actually supports the illness itself. For example, if a person should develop a cancerous tumor, his body environment is no longer in a state that is balanced or supportive of the normal interactive relationship between his body and his soul. His body environment is now supporting the tumor. His microbial population will automatically shift into a survival mode in response to the new body environment that *includes* the tumor. At this point, the state of the diseased body environment is no longer unhealthy for the microbial population. In fact,

*Body/Soul–Supportive Triangle*

*Disease–Supportive Triangle*

because of the microbes' ability to adjust to environmental changes, the microbial population now has a "healthy relationship" with the diseased body environment. As far as the tumor-supporting triangle is concerned, there is now life-sustaining "balance" among the microbes, body environment and tumor. This is not a balance that enhances, supports or sustains the body/soul partnership. In fact, that partnership has been eliminated from the triangle—it has been replaced in the triangle by the tumor—and exists within the human being as a single, untriangulated function outside the tumor-supporting triangle.

When dealing with serious illness, the active, protective strength inherent in a disease-supportive triangle, plus the invested interest in maintaining that balance from the microbial point of view need to be considered. On their own, there is no reason for the microbial population to create a different state of balance because they are now in sync with the other two points of the disease-supportive triangle. The three points have created a self-sustaining unit.

When a tumor is treated (medically), the treatment generally constitutes an "assault" on the disease-supportive triangle. What doctors and researchers tend not to understand is the powerful effort by the body's microbes to maintain the new status quo. So while the physician is working from the outside to alter or destroy the tumor, there is a strong, active and counterproductive internal microbial effort going on within the triangle to maintain status quo. As far as the microbial population is concerned, their survival is at stake. This situation cannot be underestimated when we wish to reverse an illness and return to a balanced and healthy body/soul partnership that is enhanced and stabilized by its triangle.

The Perelandra Microbial Balancing Program is designed to address microbial balance within the context of the body/soul partnership. The program's coning includes both a person's soul and the key elements of his body. The intent of the program includes his body/soul partnership—that is, microbial balancing within the human body environment in light of the individual's soul-defined state of balance. When microbial balancing is included in treatment, *the disease-supportive triangle is dismantled*. The microbes and their environment (the human body) shift back into a vital relationship with the body/soul partnership, thus forming the new triangle that actively supports the body/soul relationship and, ultimately, an individual's health. Now the tumor (or other disease) is left without an internal support system. This allows the body's natural defense mechanisms to fully address the disease and the appropriate external medical treatment to be far more effective and efficient.

The point to be emphasized when considering illness and triangulation is the invested interest of the microbes to maintain status quo and their powerful ability to do just that when their survival is being threatened. The power, strength and tenacity created by the microbes in the body because of the situation inherent in a disease-supportive triangle cannot be dismissed. A soul-supportive triangle will not form until the microbes and their environment (the human body) are shifted to a soul-supportive state of balance. And while a disease-supportive triangle is active, the efforts to restore this person to health will be an uphill battle. Because of this, the Perelandra Microbial Balancing Program must be tested not just for cancer, but for *all* diseases and health issues.
